# SUMMER HEAT

**Keep your cool on farm with our round up of sizzling summer specials.**

**From flies to fans, we've got everything you and your herd need, all with free on-farm delivery from your usual salesperson.**

# Tackle those pesky flies

# all with free farm delivery

## Fly String

DeLaval's strong, natural glue catches flies. The patented design of these curtains, sheets and string attracts flies even at dusk thanks to its 3-D pattern and colours.

Refills also available.

Part no: 96809340

## Fly Bag

Part no: 96809330

## Fly Curtain C60

Part no: 96809304

## Fly Curtain C210

Part no: 96809304

## Window Fly Trap

Part no: 96809341

## Formashield

Unique to DeLaval, Formashield is a natural, non iodine disinfectant offering exceptional value for money.

FormaShield is designed to substantially improve udder health; which can be applied before and after milking.

The teat dip uses naturally occurring formic acid as an active ingredient; has good biocidal properties and contains emollients for good skin conditioning.

The diluted solution can be dipped, but is more suitable for spraying and is tested on all DeLaval automated spray equipment.

- **Effective Mastitis Prevention** by lowering somatic cell counts (SCC) and bacterial counts by killing pathogens on the teat ends before they can enter the udder
- **Advanced Skin Conditioning:** High levels of glycerine emollients hydrate and soften the skin, keeping it smooth and supple. This reduces the chance of bacteria colonising rough or damaged skin.
- **High Visibility:** The product features a striking orange colour, making it easy for farmers to see which cows have been treated, even from a distance.
- **Safe Formulation:** Because it is acid-based, it does not leave harmful chlorate residues in the milk.
- **Can be used as a dip or a spray.**
- **Compatible with traditional parlours and automated robots, such as the DeLaval VMS.** Cost-Effective: It is a concentrated liquid typically diluted to 25%, making it economical to use and easier to store in bulk.

## Uddershield Dry

When cows are dried off it can take a week for the natural protective plug to form. UDDERSHIELDDRY® provides a physical anti-bacterial barrier, giving environmental protection to the teats during this period.

The product can be used at drying off and again pre-calving. In both cases the product is used as a final step after the teat is cleaned and after antibiotic infusion or internal teat sealant.

Pre-calving

UDDERSHIELDDRY® should be applied 14 days prior to calving and then again 3-5 days prior to calving if required.

**Ideal for use on in-calf heifers, especially in areas with high fly populations.**

UDDERSHIELDDRY® should be applied at drying off and again 7 days prior to calving if required.

**This product is also ideal for use on in-calf heifers, especially in areas with high fly populations.**

- **The 950ml pack is enough for approx. 95 cows.**
- **Ideal complement to traditional dry cow therapy**
- **UDDERSHIELDDRY® assists the natural keratin plug which is the teats defence mechanism**
- **Forms a physical flexible barrier on and in the teat for up to 7 days**
- **Quick drying within 5-10 minutes and is resistant to water, manure & urine.**

## Comet 8

**One drop of milk, one minute of your time. Automatic analysis of more than 50 antibiotic substances in only 2 hours, with real-time results sent directly to your phone.**

Do you want to make sure that the milk from your treated cow is free from antibiotics? Do you have doubts when interpreting the colour of microbial tests when detecting antibiotics in milk? Sometimes, do you have to stop the microbial assay before testing is complete, and you doubt if your samples might contain antibiotics?

**Comet 8 can help.**

## Mega Fans

**Heat stress can result in the loss of four litres of milk per animal per day, and sharply reduced pregnancy rates.**

Cows suffer from heat stress at much lower temperatures than humans. If a farmer is beginning to feel the heat and humidity, then it is quite likely the milking cows are already under stress, and this can have a severe impact on milk production and fertility. With increasingly hot British summers, heat stress in dairy cows is becoming an important consideration for British farmers. There are few places hotter and more stifling than a building filled with cows on a summer's day.

T H WHITE completed the first two HVLS 'MegaFan' installations in the UK. The very first application on this side of the Atlantic was for Jimmy Ludwell who farms at Holsworthy, North Devon.

This comprised two 24ft (7.4m) units which have already proved their worth by maintaining a comfortable

temperature and atmosphere in Jimmy's cattle shed.

The second installation, this time for four 24ft fans, was for the Hawker family who farm 1,200 acres at Hullavington, Wiltshire, where they have a herd of 400 dairy cows.

Ashton Hawker specified two 24ft fans in each of his two adjacent cattle sheds: "After just a few weeks the MegaFans have already made a considerable difference," said Ashton Hawker.

"The beds are definitely drier, increasing comfort for the cows, and because the fans can be run in either direction they can also be used to extract air from the sheds, greatly improving the atmosphere. Now I am looking forward to the difference they will make in the hot months ahead."

**Call Chris Newey on 07880 798475 to learn how Mega Fans can keep your herd cool this summer.**

**Stress levels in dairy cows relative to temperature and humidity**

# Close the methane loop & turn poo into pounds.

We all like to make best use of our assets. As a dairy farmer these will include an abundant supply of slurry. How fantastic would it be then, to use your slurry to make fuel?

Bennamann and New Holland have developed a closed-loop farm energy cycle that turns cow manure into methane which becomes tractor fuel, enabling the tractor to run the farm that produces the manure.

Here's the cycle in detail:

## 1 — Livestock Produce Slurry

On dairy farms, manure and urine are collected into slurry pits, lagoons or covered tanks. As the slurry decomposes, microbes naturally produce methane, carbon dioxide and hydrogen sulfide. In open pits this methane escapes into the atmosphere as a powerful greenhouse gas.

## 2 — Bennamann SmartCover Captures gasses.

The SmartCover is installed over the slurry lagoon which traps methane emissions, prevents rainwater dilution and creates a gas collection chamber above the slurry. Instead of allowing methane to leak away, the farm turns the lagoon into an energy source.

## 3 — Captured Gas is Cleaned and Upgraded

The raw gas is piped into a trailer-sized on-farm processing unit which removes impurities and concentrates the methane into either compressed or liquefied biomethane.

## 4 — Biomethane Becomes Tractor Fuel

The cleaned methane powers methane-capable tractors like the New Holland T6 methane Power and T7 Methane Power LNG

These tractors use methane gas instead of diesel but produce the same torque, strength and power as before.
